

HEATSEAL LAMINATES

HOT PRESS

Although this process is sometimes overlooked, the Hot Press range of laminates has many benefits that can yield higher value orders for framers, photographers and print shops. For one thing, all Hot Press laminates contain UV inhibitors to increase the fade resistance of the artwork. They also are unbreakable, easy to keep clean and come in a variety of popular finishes.

GLOSS (LUSTRE) 50µ

The most popular heatseal laminate, this film offers a unique finish that conforms to the surface it is pressed against (under heat). The normal result is a lustre finish transferred from the surface of the foam blanket in the press, but other textures can easily be applied. This film is also used as the top coating when prints are bonded to canvas.

SATIN MATT 50µ

This film is often used to laminate posters and prints, as its subtle finish closely mimics that of the printed piece. The satin sheen finish reduces glare, but does not reduce contrast, as the film is relatively thin. Also suitable for canvas bonding.

MATT 75µ

This film is characterised by a full matt finish that completely eliminates reflections. It offers additional UV protection when used behind glass, but is almost invisible. Matt film is most often used where lighting is unpredictable and uncontrollable, such as exhibition halls and other public areas. Additional heat applied during processing will give the matt film a textured surface.

HEAVY DUTY GLOSS (LUSTRE) 90µ

Except for the heavier gauge, this film is similar in most respects to Gloss Lustre 50mic film. For larger format subject matter, this film is easier to handle than a thinner film. Other uses include applications requiring a high degree of lustre.

SAND TEXTURE 90µ

This film is ideal for graphics that will be subjected to prolonged exposure in public places. It displays a pleasing sandy texture that is also scuff resistant. Sand Texture film is also ideal for social photographers who wish to show samples and copies to clients.

FINE LINEN 90µ

This delicate, fabric-textured laminate is often preferred by photographers wishing to offer a subtle yet decorative finish to their work. It is also useful for disguising minor creases and cracks in prints and posters.

COARSE LINEN 90µ

This film displays a mid-gauge fabric texture resembling rough cotton. It is often used on larger format artwork where a finer finish may be lost. The rougher gauge of this film is capable of hiding large imperfections in prints and posters.

CANVASTEX 190µ

Due to its heavy canvas texture, Canvastex is often used as an economical alternative to actual canvas bonding.

DUE TO ITS THICKNESS THIS FILM IS UNPIERCED, BUT SHOULD BE PIERCED BEFORE USE.

POLYESTER GLOSS 36µ

This film has a heat-resistant gloss finish that is popular for the production of tablemats. It is also useful for imparting a gloss finish to paper prints. Please note that the heat resistance of this film is only sufficient for hand-hot items, and not items just removed from a hot oven. For cork bases see Page 18.

THIS FILM IS UNPIERCED and SHOULD NOT BE PIERCED, AS IT WILL NOT HEAL.

All material comes pre-pierced as standard (unless otherwise stated). Un-pierced films are available on request.

GLOSS (LUSTRE)

Code	Size
L1305	650mm x 25m (25.5" x 82')
